

**Exercise 20**

Show that  $\mathbf{l}_1(t) = (1, 2, 3) + t(1, 0, -2)$  and  $\mathbf{l}_2(t) = (2, 2, 1) + t(-2, 0, 4)$  parametrize the same line.

---

**Solution**

The equation for a line is

$$\mathbf{y}(t) = \mathbf{m}t + \mathbf{b},$$

where  $\mathbf{m}$  is the direction vector,  $\mathbf{b}$  is the position vector for a point on the line, and  $t$  is a parameter.  $\mathbf{l}_1$  is parallel with  $\mathbf{l}_2$  because its direction vector is a constant multiple of that for  $\mathbf{l}_2$ :  $-2(1, 0, -2) = (-2, 0, 4)$ . Since  $\mathbf{l}_1(-1) = \mathbf{l}_2(1) = (0, 2, 5)$ , the two lines travel through the same point.  $\mathbf{l}_1(t)$  and  $\mathbf{l}_2(t)$  are therefore just two different ways of parameterizing the same line.
