

Exercise 32

For the following exercises, use synthetic division to find the quotient.

$$(x^4 - 10x^3 + 37x^2 - 60x + 36) \div (x - 2)$$

Solution

Solving $x - 2 = 0$ gives $x = 2$; this is the number that goes on the top left. Write out all the coefficients of the dividend to the right.

$$\begin{array}{r|rrrrr} 2 & 1 & -10 & 37 & -60 & 36 \\ \hline & & & & & \end{array}$$

Bring down the leading coefficient.

$$\begin{array}{r|rrrrr} 2 & 1 & -10 & 37 & -60 & 36 \\ \hline & 1 & & & & \end{array}$$

Multiply the top left number by the number brought down and put the result under the second coefficient of the dividend.

$$\begin{array}{r|rrrrr} 2 & 1 & -10 & 37 & -60 & 36 \\ \hline & 1 & 2 & & & \end{array}$$

Add the numbers in the second column.

$$\begin{array}{r|rrrrr} 2 & 1 & -10 & 37 & -60 & 36 \\ \hline & & & 2 & & \\ \hline & 1 & -8 & & & \end{array}$$

Multiply this sum of the second column by the top left number and put it in the next column.

$$\begin{array}{r|rrrrr} 2 & 1 & -10 & 37 & -60 & 36 \\ \hline & & & 2 & -16 & \\ \hline & 1 & -8 & & & \end{array}$$

Add the numbers in the third column.

$$\begin{array}{r|rrrrr} 2 & 1 & -10 & 37 & -60 & 36 \\ \hline & & & 2 & -16 & \\ \hline & 1 & -8 & 21 & & \end{array}$$

Multiply this sum of the third column by the top left number and put it in the next column.

$$\begin{array}{r|rrrrr} 2 & 1 & -10 & 37 & -60 & 36 \\ \hline & & & 2 & -16 & 42 \\ \hline & 1 & -8 & 21 & & \end{array}$$

Add the numbers in the fourth column.

$$\begin{array}{r|rrrrr} 2 & 1 & -10 & 37 & -60 & 36 \\ \hline & & & 2 & -16 & 42 \\ \hline & 1 & -8 & 21 & -18 & \end{array}$$

Multiply this sum of the fourth column by the top left number and put it in the next column.

$$\begin{array}{r|rrrrr} 2 & 1 & -10 & 37 & -60 & 36 \\ \hline & & & 2 & -16 & 42 & -36 \\ \hline & 1 & -8 & 21 & -18 & \end{array}$$

Add the numbers in the fifth column.

$$\begin{array}{r|rrrrr} 2 & 1 & -10 & 37 & -60 & 36 \\ & & & & & \\ & & 2 & -16 & 42 & -36 \\ \hline & 1 & -8 & 21 & -18 & 0 \end{array}$$

This final result is the remainder, and the numbers to the left are the coefficients of the quotient, which is $x^3 - 8x^2 + 21x - 18$.

$$(x^4 - 10x^3 + 37x^2 - 60x + 36) \div (x - 2) = x^3 - 8x^2 + 21x - 18$$
