Exercise 2.7.5

For each of the following vector fields, plot the potential function $V(x)$ and identify all the equilibrium points and their stability.

$$\dot{x} = -\sinh x$$

Solution

The potential function $V(x)$ satisfies

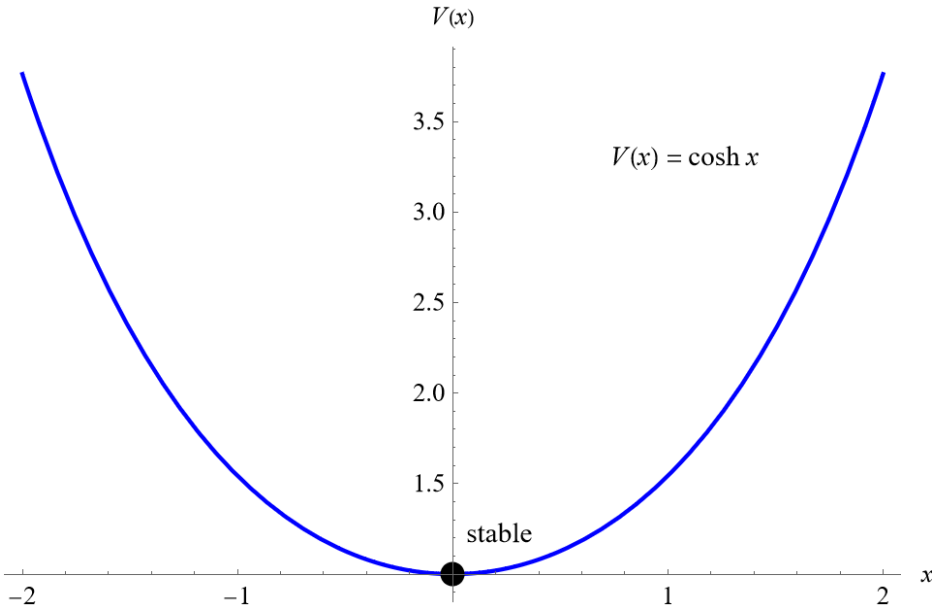
$$\dot{x} = -\sinh x = -\frac{dV}{dx}.$$

Multiply both sides by -1.

$$\frac{dV}{dx} = \sinh x$$

Integrate both sides with respect to x, setting the integration constant to zero.

$$V(x) = \cosh x$$



The graph of $V(x)$ versus x is to be thought of as a two-dimensional rollercoaster. A particle on the curve at $x^* = 0$ that's nudged in either direction will return to $x^* = 0$ because it's stable.
